PEER-REVIEW REPORT

Name of journal: World Journal of Clinical Cases

Manuscript NO: 52887

Title: Effectiveness of surgical resection for complicated liver cancer and its influencing factors: A retrospective study

Reviewer's code: 03261638

Position: Peer Reviewer

Academic degree: FIAC, FRCS, MD, PhD

Professional title: Professor, Research Scientist

Reviewer's country: Spain

Author's country: China

Reviewer chosen by: Artificial Intelligence Technique

Reviewer accepted review: 2019-12-10 00:21

Reviewer performed review: 2019-12-15 02:34

Review time: 5 Days and 2 Hours

SPECIFIC COMMENTS TO AUTHORS

This is a well designed study. Although various new treatment models have been introduced with the development of medical technology, and the survival rate of patients has been improved, surgical resection for patients with complex liver cancer is the preferred method. Because the tumor is in a special position, the risk of surgery is high, postoperative complications are easy to induce, and the prognosis is not ideal. Therefore, in the process of completely resecting the lesion and retaining the residual liver function, accelerating rehabilitation and improving prognosis have become an in-depth study in the medical community. In this study, the authors investigated the surgical resection effect and influencing factors of complex liver cancer. Comments: 1. The title. I suggest to change it to "surgical resection effect of complicated liver cancer and its influencing factors: A retrospective study" 2. Abstract. The real back ground is missing, the background now is the aim of the study. 3. The methods are described in detail. The sample size is enough. Inclusion and exclusion criteria are clear. 4. Results are very interesting. The data in tables are excellent. However, there are some Chinese comma, which should be revised. 5. Discussion. The results were well discussed, with updated references. 6. Some minor language polishing required a minor editing.
