SPECIFIC COMMENTS TO AUTHORS

Reviewer report Manuscript title: "Epidemiological investigation of Helicobacter pylori infection in elderly persons in Beijing". This study describes H.Pylori status among elderly people in Beijing. The authors report a prevalence of of H. pylori infection of 46.5%. Infection rates are higher in men, illiterate persons, smokers, and increases with age. Major comments Discussion 1- The prevalence rates among the same age group as in this study in other countries should be mentioned for comparison. 2- The statement "Older people over 60 years of age are still the group with a higher infection rate" is without reference. 3-The explanation for the decrease in the rate of H.pylori infection in Beijing that is due to "Beijing being an economically developed area" should be revised because by 2005 both Shanghai and Beijing were already "an economically developed areas". 4- In the studies that described infection rate of H. pylori among elderly people in Shanghai and Beijing reaching 72.4% and 83.4%, respectively, what were the serological tests used and the authors believe that it did not reflect the true status of H. pylori. 5- The authors ignore the role of antibiotics in reducing infection rates of H. pylori. Were there any antibiotics used in the population in the study and what these antibiotics were? 6- References are needed to explain the difference in H.pylori among men and women and not sepeculations. 7-" Previous surveys of elderly persons in different.....". what are these studies. No references were provided.
