4 Abstract

BACKGROUND

Pancreatic acinar cell carcinoma (PACC) is a rare type of malignant pancreatic cancer that represents approximately 1% of all pancreatic neoplasms. Due to its very low incidence, only a few retrospective studies are available. Although surgery is the first choice for

Multimodal approach and long-term survival in a patient ...

<https://www.sciencedirect.com/science/article/pii/S1424390315006511>

Currently, there are only five reports of **pancreatic acinar cell carcinoma** with synchronous metastases and a **survival** longer than five years (): Hashimoto et al. describe a **case** with subcutaneous fat necrosis and **recurrent** metastases to the liver. A **long-term survival** of seven years in a **case** with metastatic intrahepatic cholangiocarcinoma as a presumed diagnosis is presented by Ang et al. .

[PDF] Multimodal approach and long-term survival in a patient ...

<jaxelection.altervista.org/pancreatic/AcinarCase2016MDACC6511.pdf>

Here, we **report a case** of a **patient with recurrent** metastatic **acinar cell carcinoma** involving the liver who had presented initially with **pancreatic** panniculitis. She received chemotherapy with capecitabine and oxaliplatin prior to resection of her primary tumor and liver metastases, after which she experienced a 30 months **recurrence-free survival**.
