Retrospective Study

Colorectal adenocarcinoma patients **with** M1a diseases receiving palliative primary tumor resection gained more clinical benefits than those with M1b diseases: A propensity score matching analysis

Li CL *et al.* Palliative primary tumor resection in metastatic CRA

Cheng-Lin Li, De-Rong Tang, Jian Ji, Bao Zang, Chen Chen, Jian-Qiang Zhao

BACKGROUND

Surgical resection is regarded as the only potentially curative treatment option for **patients with metastatic colorectal cancer (CRC). The National Comprehensive Cancer Network clinical practice guidelines** do not recommend palliative surgery unless there is a risk of severe symptoms. However, accumulating evidence has shown that palliative surgery is associated with more favorable outcomes for patients with metastatic CRC.

Surgery of primary tumor improves the survival of newly ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6312064>

The primary tumor surgery is an effective means to treat or even potentially cure early-stage melanoma.⁹ However, for the melanoma patients with the primary tumor and metastatic disease concurrently occurring at the time of diagnosis (newly diagnosed metastatic patients), the necessity and effect of primary tumor surgery has never been discussed.

Oct 01, 2018 · Surgery is the oldest form of cancer therapy and can care **more** solid tumors as a single modality **than** any other therapy. ⁵ However, because of the high degree of locoregional and distant

recurrence after **primary** surgical **resection** of esophageal cancer, the 5-year overall survival is poor. ^{6, 7}
