Macrophage activation syndrome as an initial presentation of systemic lupus erythematosus

Shi LJ *et al.* MAS as an initial presentation of SLE

Lian-Jie Shi, Qian Guo, Sheng-Guang Li

Abstract

In a recent article, Sun *et al.* reported a case of 36-year-old female with macrophage activity syndrome as an onset of systemic lupus erythematosus

Macrophage activation syndrome (MAS) is a rare manifestation of systemic lupus erythematosus (SLE) with potentially life-threatening consequences. To the best of our knowledge, this is the first case reported in literature for a constellation of MAS, glomerulonephritis, pericarditis, and retinal vasculitis as initial presentation of SLE.

Macrophage activation s

Severe Potentially Life-Threatening Complica

Macrophage-activation syndrome is a severe, potentially life-threatening, complication of several chronic rheumatic diseases of childhood. It occurs most commonly with systemic-onset juvenile idiopathic arthritis. In addition, MAS has been described in association with systemic lupus erythematosus, Kawasaki disease, and adult-onset Still's disease. It is thought to be closely related and pathophysiologically very similar to reactive hemophagocytic lymphohistiocytosis. The incidence of MAS is unknown as there is a wide spectrum of clinical manifestations, and episodes may remain unrecognized.
