Dear authors, the article entitled "The fastest recurrence time for recurrent gallstone ileus: case report and literature review", by Hao Jiang and colleagues from Taizhou Central Hospital in China, is a useful contribution to better define the clinical strategy in case of gallstone ileus. There are some linguisting imprecisions, but the case in the complex is well documented and exposed. On the basis of this early recurrence, I would better stress the importance to perform surgery in one time, performing at least cholecystolithotomy, if cholecystectomy is difficult, whenever the clinical conditions allow this. I think it is always better a single longer operation than two ones.

The authors have presented an interesting case of recurrent gallstone ileus. I have following comments for the authors. 1. The title needs to be modified as mentioning fastest recurrence time doesn't look appropriate. Instead mentioning recurrent gallstone ileus is sufficient. 2. Abstract - the background needs to be modified as easy to ignore is not the appropriate term. 3. Introduction - Appropriately written. 4. Case presentation - What was the site of operation in the second surgery? Why was the hospital stay prolonged (20 days) after the second surgery? Please mention the site of bilioenteric fistula here as found during the operation. 5. Please provide intraoperative images if available. 6. Discussion - Appropriately written. 7. Conclusion - it needs to be shortened to give only the take home message. I believe its important to emphasise about through examination of the bowel and gallbladder for gallstones based on preoperative imaging during first surgery and remove them ignorer to avoid recurrence.
