## Isolated colonic neurofibroma, a rare tumor: A case report and review of literature

### Abstract

#### BACKGROUND

Neurofibromas are tumors comprised of peripheral nerve sheath and connective tissue components. They can occur sporadically or as part of familial syndromes such as neurofibromatosis type 1. Isolated colonic neurofibroma without systemic manifestations is a rarely reported clinical entity. Here we present a case of a 51 years old male with an isolated colonic neurofibroma seen on a screening colonoscopy.

#### CASE SUMMARY

Fifty-one years old male who was otherwise healthy without a significant family history
