SPECIFIC COMMENTS TO AUTHORS

The authors describe a case of frozen shoulder with rotator cuff injury. During manipulation and arthroscopic release, she developed a fracture of the inferior glenoid which along with rotator cuff tear repaired arthroscopically. They also highlight the need to identify this complication during the procedure by specifically looking for it. The authors have written the article nicely. My suggestion would be to mark the findings in the figures. It will be more informative if you can include the clinical pictures also. Regards.

SPECIFIC COMMENTS TO AUTHORS

Thanks a lot for this interesting case report. I recommend some revisions to improve the quality of case report. 1- I think authors should clarify why they chose doing manipulation before anticipated arthroscopy despite the recommendations for postponing it after arthroscopy. They stated that "some surgeons still prefer to perform the manipulation before arthroscopy to facilitate the performance of the arthroscopy " without any reference and evidence. Is this belief an anecdote? Are authors among these surgeons? Is there any evidence supporting this idea? 2- Authors please explain why they decided to surgically fix the fracture, despite the fracture size and successful report of Manusson in favor of nonsurgical immobilization. 3- I think figure 2A does not clearly show the fracture as reported in Figure caption. It should be replaced with more clear image or the fracture line should be shown with an arrow. Some grammar and spelling errors exist which should be addressed throughout the manuscript. For example forms should be changed to from in page 5, line 6.
