and prolong life of patients whose kidneys do not work normally by effectively removing waste products such as toxins from the blood. The conventional hemodialysis cannot remove toxins clearly, which may induce complications, and which then will lead to rising medical expense accordingly. Over the prolonged dialysis duration, the increased and accumulated toxins obviously may pose a deadly threat to patients. In this study, the authors examined the efficacy of high flux hemodialysis in elderly patients with chronic kidney failure. Data collection is good display. And the methods are reasonable. In this results section, the data in the tables are interesting, especially the complications in the two groups. Discussion is acceptable. Overall, this brief study is well written, I recommend to accept it for publication after a minor language editing. And it seems the PMID numbers are missing in the references list, please check and revise.
