SPECIFIC COMMENTS TO AUTHORS

This brief study is designed to explore the efficacy of ultrasound-guided selective proximal and distal brachial plexus block in rapid rehabilitation surgery for hand trauma. The aim of the study is clear, and methods are reasonable. Sample size is acceptable. In the results section, the tables are good, but should be moved to the end of the manuscript. A minor language polishing should be corrected.

Answer: Thank you for your comments. We have proofed the manuscript, and minor language polishing has been revised.
