SPECIFIC COMMENTS TO AUTHORS

Schwannoma is a rare benign, encapsulated tumour of the nerve sheath under the tongue, mostly occur as solitary tumours with classical histological pattern and several common morphological variants. To our knowledge, multiple schwannomas with pseudoglandular element synchronously occurring under the tongue are of great rarity and we first report one in the present case. In this manuscript, the authors reported a case of Schwannoma. This case is rare, and interesting. The case presentation is good, and very detail. The discuss of this case is acceptable. Figures of the patient's laboratory examination and CT are interesting and useful. Overall, this manuscript is very well written. I have no other specific comments.

SPECIFIC COMMENTS TO AUTHORS

It is a rare and interesting case with good image quality. Although rare, multiple schwannomas with pseudoglandular element do exist in patients presented with mass under the tongue. Oral surgeons should be aware of the existence of multiple schwannomas with pseudoglandular element when considering masses under the tongue due to the different prognosis between multiple schwannomas with pseudoglandular element and mucoepidermoid carcinoma. The authors discussed clearly. It can be considered for publication.

SPECIFIC COMMENTS TO AUTHORS

In this case report, the authors present very rare case of encapsulated tumour of the nerve sheath under the tongue. CT showed three low-density oval neoplasms under the tongue, which were cystic-solid lesion and unclear boundary. The patient has not cutaneous tumors, VIII nerve tumours, or lens opacities, and no history of NF2 or confirmed schwannomatosis in any first-degree relative. MRI scan showed no evidence of vestibular schwannoma. This is an interesting and instructive case which was very good presented. So, it deserves publication. However, there should be more references for a literature review.
