SPECIFIC COMMENTS TO AUTHORS

This is an interesting manuscript regarding the imaging characterization of pancreatic ductal adenocarcinoma using CT quantitative analysis of contrast-enhanced images in relation with tumor grading. Considering the specific topic of the paper, although the study design is original as well as the methodology is appropriate, the main drawback of the study is the limited sample size of patient population divided into the three groups. The message of the manuscript is attractive, however a wider series of patient should be welcome to provide more significant and convincing results to have effective implications in clinical practice.
