#### **SPECIFIC COMMENTS TO AUTHORS**

The authors reported a case of LCH involved in multi-organs with various symptoms. It is obvious that this case is a rare and the information can be helpful to the physicians for the future case. However, there are several concerns before the further consideration for the review process. 1. The pathogenesis of LCH affecting various organs is not clearly described. 2. For the MR images, the authors described that there was a hypo intensity lesion in the liver (red arrow in Fig 3), however, it is actually high intensity. 3. It is not clearly demonstrated that from which part of the liver, the sample for the histological analysis was collected. 4. Actually, no obvious portal areas were seen in the liver tissue shown in Figure 4F.

#### **SPECIFIC COMMENTS TO AUTHORS**

The authors have reported a case of multisystem LCH which took five-years for definite diagnosis. Multisystem LCH in adult case is very rare and their clinical experience provides significant clinical implications. Thus, I consider this single case report has potential of publication, although I have some comments. The details of pathological findings including immunohistochemistry and consideration for diagnosis of LCH should be described in section of "FINAL DIAGNOSIS". In this section, they described that "In the liver biopsy samples, we did not detect any histiocytes". However, liver tissue usually contains histiocytes (Kupffer cells) so that sentence is incorrect. I guess that they could not detect any LCH lesion in liver biopsy and possibility of sampling error should be discussed. Information regarding the date for imaging study is unnecessary. Only information of years and months are enough.
