SPECIFIC COMMENTS TO AUTHORS

In this manuscript, the authors report a case of pseudohyperkalemia caused by the essential thrombocythemia in a patient with chronic renal failure. And, they suggest that serum and plasma potassium values should be measured for patients whose platelet counts exceeded $500 \times 10^9/L$ to eliminate complications due to pseudohyperkalemia, especially for those with chronic renal failure. This case report is clinically interesting, but there is one point that needs to be addressed. Minor comment: They should ensure that the number of decimals of each variable correspond in Table 1.
