Successful management of a tooth with endodontic-periodontal lesion: A case report

Hamed Alshawwa, Jia-Feng Wang, Min Liu, Shu-Fen Sun

Abstract

BACKGROUND

Endodontic-periodontal lesion is a commonly encountered dental condition. However, the prognosis of the condition may vary from good to poor. Some of the cases can be associated with a poor prognosis that requires tooth extraction. This report presented a

In this report, several successful endodontic-periodontal lesion cases were presented with different treatment modalities and classified according to the new classification system reported by Al-Fouzan in 2014 . The classification of the first case was a primary endodontic lesion with drainage through the periodontal ligament through a **fistula**.

Successful Multidisciplinary Management of an Endodontic ...

<https://pubmed.ncbi.nlm.nih.gov/31562681>

Introduction: This case report describes the **collaborative** management of an extensive combined endodontic-periodontal lesion related to a **long palato-radicular groove (PRG)** on a **maxillary lateral incisor**. Cases with similar severity have been reported minimally in the endodontic journals but even less in the periodontal journals.
