The SARS-CoV-2 virus is an RNA virus that uses the angiotensin-converting-enzyme 2 (ACE2) receptor to enter human cells. An infection with the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), also called the coronavirus disease 2019 (COVID-19), typically causes fever, respiratory symptoms, malaise and myalgia.

May 30, 2020 · SARS-COV-2 infection was suspected based on occupational history and worsening clinical course. Multiple nasopharyngeal samples were obtained for SARS-COV-2 testing. The first two run at independent laboratories (Lab A and Lab B) were negative and the third, positive (Lab C). A fourth confirmatory sample, sent to Lab A, was also positive.

Suspected SARS-CoV-2 infection with fever and coronary heart disease: A case report

One Suspected Case of Coronavirus Disease 2019

#### Abstract

##### BACKGROUND

The coronavirus disease 2019 (COVID-19) is an emerging infectious disease caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). Suspected cases accounted for a large proportion in the early stage of the COVID-19 outbreak. The deviation of nucleic acid test on throat swab (the current gold standard of COVID-19), caused by variation in sampling techniques and reagent kits, coupled with non-specific clinical manifestations make confirmation of the suspected cases difficult. Proper management of the suspected cases of COVID-19 is crucial for disease control.

##### CASE SUMMARY

A 65-year-old male was presented with fever, lymphopenia, and chest computed tomography (CT) images similar to COVID-19 after percutaneous coronary intervention. The patient was diagnosed as having bacterial pneumonia with cardiogenic pulmonary edema instead of COVID-19. This was based on four-times
