1 Pericardial effusion with tamponade: An uncommon presentation **2** leading to the diagnosis of eosinophilic granulomatosis polyangiitis

Alam L *et al.* Clinical vignette and literature review

Loba Alam, Glenmore Lasam, Robert Fishberg

Abstract

BACKGROUND

5 Eosinophilic granulomatosis polyangiitis (EGPA) is a small vessel necrotizing vasculitis that commonly presents as peripheral eosinophilia and asthma; however, it can rarely manifest with **12** cardiac involvement such as pericarditis and cardiac tamponade. Isolated pericardial tamponade presenting as the initial symptom of EGPA is exceedingly rare.

Cardiac Tamponade: An Uncommon Presentation of ...

https://journal.chestnet.org/article/S0012-3692(16)36759-9/fulltext

DISCUSSION: The reported frequency of cardiac involvement with GPA ranges from 6-44% (1); the largest GPA case series found a 10% overall incidence of pericarditis (2). To our knowledge this is the first description of **tamponade leading to the diagnosis** of GPA, though four cases of **tamponade** in the setting of established GPA have been previously described.

https://journal.chestnet.org/article/S0012-3692(16)36759-9/pdf

tamponade leading to the diagnosis of GPA, though four cases of **tamponade** in the setting of established GPA have been previously described. This patient was successfully treated with pericardiocentesis and immunosuppression. CONCLUSIONS: Pericarditis is not **uncommon** in GPA and can rarely result in **tamponade**.

Jul 29, 2014 · Acute pericarditis with slight **pericardial effusion** is a typical manifestation in EGPA, though hemodynamically significant **pericardial effusion** has been reported in a few cases. We **report a case** that initially presented with isolated cardiac **tamponade**, which was followed by systemic manifestations of EGPA over 3 weeks.
