[bing.com/images](https://bing.com/images)

Figure 2. (A) Preoperative and (B) 3-month postoperative weight bearing radiographs of a 47-year-old man who underwent opening wedge high tibial osteotomy for symptomatic isolated medial compartment osteoarthritis. Preoperative radiographic measurements of lower extremity were the basis for 10° correction of preexisting varus deformity of proximal tibia. Tricalcium phosphate substitution of osteotomy was used to promote rigid bone healing. TomFix Medial High Tibial Plate (Synthes) was used for fixation.

Dec 14, 2019 · **Medial open wedge high tibial osteotomy** (MOWHTO) is an effective surgical procedure for the treatment of **medial compartment osteoarthritis of the knee** as well as for the correction of lower extremity malalignment [1,2,3]. With favorable clinical outcomes and improved surgical techniques, MOWHTO has become increasingly popular [4,5,6]. Although numerous advantages of MOWHTO have ...

## [High tibial osteotomy in medial compartment osteoarthritis ...](#)

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3225572>

The treatment of isolated **medial compartment osteoarthritis** (OA) in the young or physically active patient is a challenging problem. The rationale for **high tibial osteotomy** (HTO) in **medial compartment** OA with varus deformity is to correct varus malalignment and to redistribute load to the non-diseased lateral **compartment of the knee**.
