

## Response to the reviewers' comments

We would like to thank the reviewers and the handling editor for their hard work. We have revised the manuscript according to the suggestions. Here are our point-by-point response to the reviewers' comments.

Reviewer 1: The case in this study is very well reported. The confocal laser endomicroscopy is used in the diagnosis of gallbladder polyps. Interesting study. I recommend to accept it for publication.

**Response:** Thank you for the compliments.

Reviewer 2: This is an interesting case diagnosed by ultrasound with a polyp of 21 mm in the gallbladder wall. The case is rare, and the manuscript is very well written. In this study, the authors used Confocal laser endomicroscopy for the first time to examine the morphology of cholesterol polyps as well as the different parts of normal gallbladder mucosa. So, the confocal laser endomicroscopy should be prioritized in the diagnosis of the gallbladder polyps. I have no specific comments to the authors. Only some minor language polishing should be corrected.

**Response:** Thank you for the compliments. We have polished our manuscript accordingly.
