**Snapping wrist due to bony prominence and tenosynovitis of the first extensor compartment: A case report**

A new etiology of snapping wrist

### Abstract

#### BACKGROUND

A snapping wrist is a rare symptom that results from the sudden impingement of one anatomic structure against another, subsequently causing a sudden movement only during wrist movement.

#### CASE SUMMARY

A 30-year-old woman with a history of right wrist contusion reported right wrist snapping after exercise. The snapping became symptomatic after moving heavy objects.
