

Informed Consent

Dear Patients,

Partial contents in the document base on requirements of the laws and regulations. The document has reviewed and approved by the ethical committee so as to protect interests of participants.

Research background: Our previous study demonstrated that retinoblastoma binding protein (RBBP4) is upregulated in colon cancer, and correlated with poor prognosis of colon cancer and hepatic metastasis. However, the potential biological function of RBBP4 in colon cancer is still unknown.

This study aimed to: To investigate the biological role and the potential mechanisms of RBBP4 in colon cancer progression.

All of your legitimate rights would still be reserved even you have signed the informed consent. The researcher is confidential for your personal information.

Your signing of the informed consent represents that you approve your medical data is used on occasion as above described.

Statement of agreement from participant:

I have read introduction of the research as above and fully understand possible risks and benefits in the participation. I agree to participated in the research as introduced in the document.

Signature of participant:

Date:

2017.9.1

Statement of researcher: I confirm that I have explained the details of the research to patients, especially for possible risks and benefits in the participation.

Signature of researcher:
