May 26, 2019 · Abstract. BACKGROUND. This case report discusses a modified approach for maxillary sinus augmentation, in which platelet-rich fibrin, endoscope, simultaneous implant placement, and sinus floor elevation (PESS) were applied for a maxillary sinus floor lift in a 40-year-old patient. CASE SUMMARY.

May 26, 2019 · CASE SUMMARY: A 40-year-old woman suffered missing upper right first molar. Implant stability quotient and cone-beam computed tomography (CBCT) were used to evaluate the diagnosis. CBCT showed insufficient posterior maxillary bone with a mean residual alveolar bone height of only 3.5 mm. The patient underwent a minimally invasive sinus floor elevation endoscopically. The sinus membrane ...

Case Report A total of nine patients (ten sites), aged between 25 and 60 years with unilateral/bilateral edentulous and atrophied posterior maxilla, who required sinus augmentation before implant placement, were included in the study. Informed written consent was obtained from all the patients explaining the possible procedural side effects.

Some results are removed in response to a notice of local law requirement. For more information, please see [here](#).

Abstract

BACKGROUND

In this case study, a minimally invasive transalveolar using platelet-rich fibrin and bone substitute with simultaneous implantation was applied in an elderly patient. We analysis the cone-beam computer tomography (CBCT) to evaluate bone regeneration.
