**Multiple ectopic goiter in the retroperitoneum, abdominal wall, liver, and diaphragm
a case report and literature review**

Two-year follow-up of Multiple ectopic goiter

Lan-hui Qin, Feng-yi He, Jin-yuan Liao

Abstract

BACKGROUND

Ectopic thyroid is a rare developmental disorder, typically found in lingual areas, and most distantly in the abdomen. Thyroid ectopia in multiple regions is extremely rare. To date, there are no reports of ectopic goiter in four regions of the abdominal cavity in a single patient.

CASE SUMMARY

We present a case of thyroid ectopia in four areas of the abdomen, comprising normal orthotopic thyroid tissue. A 36-year-old woman, who underwent ovarian teratoma resection 10 years previously due to symptomatic ovarian teratoma, was referred to our hospital for treatment of an incidental hepatic mass. The magnetic resonance imaging

Two cases of ectopic liver attached to the gallbladder wall

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2020551>

Introduction. Ectopic liver is a rare developmental anomaly in which liver tissue is situated outside the liver and has no hepatic connection 1. Ectopic liver tissue can occur in several different organs such as the diaphragm, hepatic ligaments, omentum, stomach, retroperitoneum and thorax 2,3, but the gallbladder is the commonest site of origin.

Challenge in preoperative diagnosis of retroperitoneal ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4694507>

Ectopic locations other than thorax were reported, such as diaphragm [5,6], esophagus [7,8], stomach, ileal mesentery, neck [11,12], abdominal wall, periscapular area, and so on. Most cysts measured <5 cm in diameter exhibit no symptoms, which are usually related to secondary infection or compression of adjacent structures.
