#### **SPECIFIC COMMENTS TO AUTHORS**

The primary purpose of treatment for children with T1DM is to achieve the best possible blood glucose concentration, minimize the occurrence of hypoglycemic events, and prevent the long-term complications of diabetes. Various complications caused by poor blood glucose control convey a heavy burden to children and their families. It is extremely challenging for children and their families who are at an important stage of physical and psychological transformation. Children with T1DM, especially those under 13, need help with disease management from their parents, who are the primary caregivers. In this study, the authors described the true inner feelings of parents caring for children with T1DM using descriptive research methods and to classify and summarize parents' experience when adapting to the role of caregiver for children with T1DM. This study is well designed and the the results are interesting. Comments: 1. There are some minor language polishing should be revised. 2. The discussion is too long, please short it. 3. A background should be added to the abstract.
