SPECIFIC COMMENTS TO AUTHORS

Administering statins is an important measure for preventing atherosclerotic diseases. Many studies have confirmed that long-term application of statins can reduce cardiovascular events and improve the prognosis of coronary heart disease. Although previous studies have found that different ways of administering statins may affect the occurrence of cardiovascular events, in clinical practice, it is unclear whether different administration methods have an effect on coronary artery plaques. In this study, the authors analyse the effect of different statin application methods on coronary artery plaques clinically. The study is well designed and the manuscript is well written. Some minor comments: 1. There are some minor language polishing, which should be corrected. 2. Tables are good, however, an editing is required. And please move the tables to the end of the manuscript. 3. The data in figure 1 is same with the main text, please check if it can be deleted.

SPECIFIC COMMENTS TO AUTHORS

This is an interesting study of the effects of different statin application methods on plaque in patients with coronary atherosclerosis. The design of the study is very good, and the results are interesting. Comments:1. Background is missing in the abstract. 2. The title "Introduction" in the first section of the main text is missing. 3. The figure 1 can be deleted. 4. Discussion is somewhat long, please short it. 5 References are updated, but an editing is required.
