SPECIFIC COMMENTS TO AUTHORS

Dear Sir, It is really a case presentation that should be printed as it is representative and interesting. It would be interesting if you complete your analysis if you let us know what could had had happened as a contributing pathogenic factor in this case, as you remark that "are only discovered incidentally when patients are undergoing abdominal surgery or imaging evaluations" and are you expecting your patient should take anticoagulants for a long time? And second, after the thrombolysis procedure did you performed a new doppler scan or angio CT scan to verify the outcome? Are you planning to do? Why or why not? and if you already had donde could you show us? Hope to have your prompt answer in order to print it. Sincerely

SPECIFIC COMMENTS TO AUTHORS

Left sided IVC refers to a variant course of the inferior vena cava. It is the most common anomaly of IVC and occurs due to persistence of left supracardinal vein. Deep vein thrombosis occurs with a prevalence of 1:1000. It is seen less in younger population with an estimated incidence of 1:10000. Anomalies of IVC are an independent risk factor for DVT. DVT associated with left sided IVC usually affects young population. This case is 66 years. In general, IVC malformations (left sided IVC) are often DVT in younger population. I ask some questions to author. 1. Please tell me the reason why this case developed at 66 years. 2. Tell me the etiology of this patient's DVT.
