SPECIFIC COMMENTS TO AUTHORS

Thanks to the authors for this case report. This agent is mostly used in the treatment of Crohn's disease. This case report is important as it reminds patients receiving Infliximab to closely monitor.

SPECIFIC COMMENTS TO AUTHORS

IBD and colorectal cancer with a worldwide increasing incidence and prevalence, are important gastroenterological pathologies that require special attention to patient management. Despite the fact that the therapeutic agents, including biologicals, are highly effective in the management of patients with IBD, the safety and long-term effects of biologic therapy are not fully understood. Infliximab has been used for over 20 years in clinical practice and is considered a relatively safe drug, although interference with the patient's immune system a priori can lead to serious infections and malignancies. The presented case of well-differentiated adenocarcinoma in a patient with IBD after infliximab therapy is interesting and clinically important, since it shows the possibility of rapid growth and progression of neoplasia, possibly induced by biological therapy. This case can really increase the attention to the management of IBD patients with a focus on careful diagnosis and regular/continuous monitoring of patients on biologicals. The case is well described and illustrated and can be recommended for publication. References are relevant, fully consistent with the topic of the manuscript and without self-citation.

Thanks to the authors for this good and interesting case report. Infliximab is effective in the management of patients with IBD. This agent is mostly used in the treatment of Crohn's disease. Malignancy may be induced by Infliximab. Because of that, this case report is important as it reminds patients receiving Infliximab to closely monitor.
