**Undifferentiated embryonal sarcoma of the liver** (UESL), a rare tumor that predominantly affects children, generally has been considered an aggressive neoplasm with an unfavorable prognosis. More recent reports have indicated that modern multimodal treatment and supportive care improve the survival of children with UESL.

**Recurrent undifferentiated embryonal sarcoma of the liver in adult patient treated by Perbrolizumab: A case report**

Undifferentiated embryonal sarcoma treated by Perbrolizumab

**Abstract**

**BACKGROUND**

Undifferentiated embryonal sarcoma of the liver (UESL) is an unusual neoplasm that develops in adults. The main treatments for UESL are upfront gross total surgical resection and adjuvant multiagent chemotherapy. Here, we report a case of recurrent UESL in an adult treated with pembrolizumab and discuss a method to identify proper candidates for anti-PD-1 treatment.
