Underwater endoscopic mucosal resection: an alternative ...

<https://www.ncbi.nlm.nih.gov/pubmed/28994567>

Underwater **endoscopic mucosal** resection (UEMR) is a novel technique where air is suctioned out and replaced by water to decompress the **colon** so that the flat lesions assumes a more polypoid shape facilitating its removal with the standard snare resection. We report the feasibility and safety in our **series** of patients utilizing this technique.

[Underwater endoscopic mucosal resection: an alternative ...](#)

<https://www.ncbi.nlm.nih.gov/pubmed/28994567>

BACKGROUND: Large sessile/flat **colonic polyps** are traditionally removed by lift polypectomy. Underwater **endoscopic mucosal** resection (UEMR) is a novel technique where air is suctioned out and replaced by water to decompress the **colon** so that the flat lesions assumes a more polypoid shape facilitating its removal with the standard snare resection.

[Endoscopic mucosal resection and snare polypectomy for ...](#)

<https://pubmed.ncbi.nlm.nih.gov/24871067>

Treatment and outcome: **Endoscopic mucosal** resection (EMR) and snare electrocautery were used to resect the mass and a definitive histopathologic diagnosis of a sessile colorectal polypoid adenoma was made. A 9.9-mm gastroduodenoscope was used during colonoscopy to inspect the mass.

[Ablative Therapies for Colorectal Polyps and Malignancy](#)

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4095981>

Ablative therapies for **polyps** and malignancies of the **colon** and rectum were first described decades ago but modalities have since evolved as new technologies emerge. Choosing **ablation** over resection for therapeutic benefit should be highly selective, especially for high risk **polyps** and early malignancies.
