SPECIFIC COMMENTS TO AUTHORS

1. This is an interesting case, which describes the intensive care management of a patient with unilateral pulmonary hemorrhage caused by biting tracheal intubation during emergency due to spinal stenosis. The important role of anesthesiologists in the postoperative stage was evaluated. The writing is clear and the argument is reasonable.
2. However, there is no relevant pathological data in this paper, and the cause of bleeding needs further study.
3. It is suggested that the revised version can be published in this journal.

1. This paper describes a 78 year old asthmatic patient who bit endotracheal intubation in the process of postoperative postural change and developed unilateral alveolar hemorrhage associated with NPPE after a brief airway obstruction. It has a certain clinical specificity, and describes the perioperative management of a patient with unilateral pulmonary hemorrhage caused by biting tracheal intubation in emergency due to spinal stenosis. It is suggested that anesthesiologists should not cause airway irritation during asthma attack. It has a certain clinical science. 2. The quality of this manuscript is good. It focuses on the intensive care management of a patient with unilateral pulmonary hemorrhage caused by biting tracheal intubation in emergency due to spinal stenosis. We assessed the important role of anesthesiologists in the postoperative phase. With unique insights. 3. This case is a clinical case, which is not widely representative. We hope to continue to collect similar cases, summarize and put forward corresponding prevention and treatment measures.
