SPECIFIC COMMENTS TO AUTHORS

This is an interesting manuscript with a hot issue, and such clinical research is likely to attract the attention of clinicians. However, there are a few points that need to be added:

1) In a clinical study with such a small sample, it is difficult to draw a convincing conclusion, that the longer interval from symptom onset to FMC is the cause of increased MACE in-hospital and at 14 days in the COVID-19 group. The conclusion needs larger samples and randomized controlled studies for further confirmation. Please add such concerns in the limitation section. 2) When the authors draw the current conclusion, they should provide baseline data on the location of myocardial infarction, the anatomical characteristics of culprit coronary and the non-culprit ones, and other baseline data that affect the outcomes of the two groups of STEMI patients. 3) How to define hyperlipidemia in Table 1?
