Prolonged use of bedaquiline in two patients with pulmonary extensively drug-resistant tuberculosis: Two case report

36-week bedaquiline treatment for XDR-TB

Abstract

BACKGROUND

Bedaquiline is among the prioritized drugs recommended by the World Health Organization for the treatment of extensively drug-resistant tuberculosis (XDR-TB). Many patients cannot achieve better clinical improvement after bedaquiline is stopped at 24-week. However, there is no recommendation or guideline on bedaquiline administration beyond 24 wk, which is an important consideration when balancing the benefit of prognosis for XDR-TB against the uncertain safety concerning the longer
