BACKGROUND Low-grade appendiceal mucinous neoplasms (LAMNs) are cytologically low-grade tumors of the appendix and are a frequent cause of **pseudomyxoma peritonei**. They can become a diagnostic challenge when they metastasize to the ovaries, where they may mimic primary ovarian mucinous tumors. CASE REPORT We

Jan 01, 2020 · Nine lymph nodes were examined and all were negative. No lymphovascular invasion. The patient was diagnosed as a well-differentiated low-grade AM neoplasm with stage 0 (pTis, pN0, M0) based on the 8th edition of the AJCC Staging System (Fig. 4A, B, C, and D). The diagnosis of a low grade appendiceal mucinous neoplasm was made.

Jan 21, 2009 · Introduction. Tumors of the appendix are rare clinical entities occurring in less than 2% of all appendectomies []. Appendiceal tumors that can be confidently placed in the low-grade group and are confined to the appendix are considered clinically benign []. Frequently, these tumors are discovered incidentally either during a survey or at the time of surgery for other causes [].
