Christopher M. Watson, Robert G. Sawyer. in Netter's Infectious Diseases, 2012. **Tertiary Peritonitis.** Tertiary peritonitis, defined loosely as a recurrent or persistent intraabdominal infection after initial treatment, has become more common as modern technology allows the support of increasingly ill patients. In a study from 1998, the rate of **tertiary peritonitis** after secondary **peritonitis** ...

What Is Peritonitis? Types, Causes, Signs, Symptoms ...

<https://www.medicinenet.com/peritonitis/article.htm>

Tertiary peritonitis: Tertiary peritonitis is caused by the bacterium *Mycobacterium tuberculosis* (TB), and is referred to as **tuberculosis peritonitis**. Chemical peritonitis (also termed sterile peritonitis): Chemical peritonitis is caused by leakage of sterile fluids that are irritants to the peritoneum; for example, bile, blood, or barium used as a contrast agent during procedures and tests.

Can peritonitis be treated with antibiotics?

Can peritonitis cause cloudy dialysis?

Peritonitis

Medical Condition

Inflammation of peritoneum, the membrane that lines the inner abdominal wall and encloses organs within the abdomen.

Common (More than 200,000 cases per year in US)

Requires lab test or imaging

Treatment from medical professional advised

Can last several days or weeks

Peritonitis commonly occurs due to bacterial infection following any rupture (perforation) in the abdomen, colon, appendix or as a complication of other medical conditions. Symptoms include abdominal distension, bloating, fever, nausea and vomiting and loss of appetite. Treatment includes antibiotics and may involve surgery.

Tertiary peritonitis

#### Abstract

Intra-abdominal infections can be classified into uncomplicated or complicated (peritonitis). Peritonitis is divided into primary, secondary, and tertiary. Tertiary peritonitis is the less common but the most severe among peritonitis stratifications, being defined as a recurrent intra-abdominal infection that occurs 48 h after a well-succeeded control of a secondary peritonitis. This disease has a complex pathogenesis that is closely related to the capacity of the peritoneal cavity to activate immunological processes. Patients who progress to persistent peritonitis are at an increased risk of developing severe infections, complications such as sepsis and multiple organ failure.

Peritonitis is inflammation of the peritoneum — a silk-like membrane that lines your inner abdominal wall and covers the organs within your abdomen — that is usually due to a bacterial or fungal infection. Peritonitis can result from any rupture (perforation) in your abdomen, or as a complication of other medical conditions. Peritonitis requires prompt medical attention to fight the infection and, if necessary, to treat any underlying medical conditions. Treatment of peritonitis usually involv
