Non-Alcoholic Fatty Liver Disease and Gallstone Disease

Abstract**BACKGROUND**

Gallstones and cholecystectomy have been proposed as risk factors for non-alcoholic fatty liver disease. The reason for this may be that both gallstones, as well as non-alcoholic fatty liver disease share several risk factors with regards to their development. Currently, there is a lack of sufficient evidence showing an association between these clinical conditions

Nonalcoholic fatty liver was associated with asymptomatic

Non-Alcoholic Fatty Liver Disease

Medical Condition

A condition in which fat accumulates in the liver in people who drink little or no alcohol.

- Very common (More than 3 million cases per year in US)
- Requires lab test or imaging
- Treatments can help manage condition, no known cure
- Can last several years or be lifelong

The cause of non-alcoholic fatty liver disease is not clearly understood. It is associated with obesity, insulin resistance, hyperglycemia, and high levels of fat in blood. The condition does not usually cause symptoms. In some cases, fatigue, enlarged liver, and pain in the upper right abdomen is seen. Non-alcoholic fatty liver disease has no specific treatment. It involves treating underlying conditions such as obesity.

Symptoms

Usually asymptomatic. Symptoms may include:

- Fatigue
- Enlarged liver
- Pain the upper right abdomen
- Ascites (swelling in the belly)
- Jaundice
- Enlarged spleen

If it progresses to cirrhosis, the following symptoms are seen:

- Enlarged breasts in men
- Red palms
- Internal bleeding
- Fluid retention

Treatments

Non-alcoholic fatty liver disease has no specific treatment. Treat the underlying conditions and make lifestyle changes.
