Infiltrating ductal breast carcinoma with monoclonal gammopathy of undetermined significance: A case report

Infiltrating ductal breast carcinoma with MGUS

Abstract

BACKGROUND

Infiltrating ductal breast carcinoma with monoclonal gammopathy of undetermined significance (MGUS) is rare and easily misdiagnosed. Most patients are first diagnosed with MGUS. We report a rare case of MGUS secondary to infiltrating ductal breast carcinoma. We also review the literature to analyze the clinical characteristics and diagnostic methods.

Removal of a Silicone Gel Breast Implant in a Multiple ...

<https://pubmed.ncbi.nlm.nih.gov/33082755>

A 52-year-old African-American woman with a prior history of monoclonal gammopathy of undetermined significance (MGUS) developed **infiltrating ductal carcinoma** of the left breast. Following a mastectomy, she underwent reconstruction with a silicone gel breast implant. Three years later, her MGUS had progressed to active multiple myeloma (MM).

An atypical presentation of infiltrating ductal carcinoma

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5353832>

The patient opted for **breast-conserving lumpectomy** of the left breast. The histopathological report showed the tumor cells are arranged in cords, nests, and as individual cells confirming **infiltrating ductal carcinoma** (2 mm) with Nottingham Grade II [Figure 5]. After surgery, four cycles of docetaxel and cyclophosphamide were given every 21 days.

Rare coexistence of invasive papillary carcinoma with ...

<https://www.ncbi.nlm.nih.gov/pubmed/18573787>

This **report** presents a rare **case** of a 35-year-old man with dual malignancy in the same breast. The patient had two separate nodules, one with the morphology of **invasive papillary carcinoma** and the other having features of an **infiltrating ductal carcinoma**. To the best of our knowledge this is the first **case report** describing the coexistence of these two entities.
