## Coronary intravascular brachytherapy for recurrent ...

<https://www.sciencedirect.com/science/article/pii/S1553838920305042>

Aug 23, 2020 · 1. Introduction. Drug-eluting stents (DES) significantly reduce the risk of in-stent restenosis (ISR) compared with bare metal stents (BMS) []. However, the incidence of ISR and target lesion revascularization (TLR) after DES implantation remains high: 5–8% at one year and 13–17% at 5 years []. Recurrent ISR is defined as having two previous episodes of ISR and previous treatment ...

Discussion

See Editorial by Kleiman Percutaneous coronary intervention (PCI) using coronary stents is a universal and established therapeutic modality in the management of symptomatic coronary artery disease. However, in-stent restenosis (ISR) requiring recurrent revascularization remains the Achilles heel of this procedure.<sup>1</sup> Drug-eluting stents (DES) are associated with a much lower incidence of ISR compared with bare metal stents (B...
