GOECP/SEOR radiotherapy guidelines for small-cell lung cancer

Guidelines for small-cell lung cancer

Abstract

Small cell lung cancer (SCLC) accounts for approximately 20% of all lung cancers. The main treatment is chemotherapy (Ch). However, the addition of radiotherapy (RT) significantly improves overall survival (OS) in patients with non-metastatic SCLC and in those with metastatic SCLC who respond to Ch. Prophylactic cranial irradiation (PCI) reduces the risk of brain metastases and improves OS in both metastatic and non-metastatic patients. The 5-year OS rate in patients with limited-stage (LS) disease (non-metastatic) is slightly higher than 30%, but less than 5% in patients with extensive-stage
