SPECIFIC COMMENTS TO AUTHORS

An interesting paper comparing prospectively 2 colon preparations both used in the split fashion: a standard 4 liter PEG preparation with a 3 liter PEG preparation added with anti-foam agent simethicone. The paper has been produced in China and its worth is related to the lower efficacy of slow volume preparations in Asians. A 3-liter preparation could be thus suggested as a valuable alternative to standard 4-liter products to improve patients' acceptance. The second peculiarity of the study is the use of simethicone as an anti-foam agent in the 3 liter preparation. The paper is clear and well written. Data are clearly described. Results are reliable and consistent with the premises. My only concern is about the bubble score: to my best knowledge, there are no validated scores evaluating how bubbles may impact on colon visibility. I think that authors should describe how they have developed such a scale; otherwise, they should report in the reference where such a scale has been already validated and used.

With regards to my previous comment, the authors should report the 4 papers that have used the bubble scale also in the paper
