

Reviewer #1:

Q:The authors presented a progressive disfiguring facial mass with pupillary axis obstruction from Morbihan disease. Morbihan disease is not common. This type of presentation is less common.

Thank you so much for your consideration and support.

Reviewer #2:

Q1. Why you choose to use the term "disease" and not "syndrome" knowing that many references, actually, prefer using syndrome for specific reasons,,,?

The text has already been revised accordingly.

Q2. Kindly give details (dosage, uration, etc.) concerning the Isotretinoin and tetracyclines you gave to the patient after surgery

The text has already been revised accordingly and see it in the treatment.

Q3. Since it is a very rare condition, try to add in the discussion more details about the history of the disease, the origin of the name....

The text has already been revised accordingly and see it in the introduction.

Q4. In the conclusion: remove " in summary" from the beginning of the paragraph

The text has already been revised accordingly and see it in the conclusion.
