**Pyoderma Gangrenosum**

Medical Condition

A condition that causes tissue to become necrotic leading to ulcers and chronic wounds, commonly on the leg.

- 👤 Very rare (Fewer than 20,000 cases per year in US)
- 🧪 Requires lab test or imaging
- 👨‍⚕️ Treatment from medical professional advised
- ⌚ Can last several months or years

The exact cause is not known. It is attributed to immune system dysfunction. Characterized by small red bumps on the skin which develop into large painful open sores. Treatment mainly includes use of analgesics, systemic corticosteroids and immunosuppressants.

**Symptoms**

It starts as a small red bump and then develops into a large open sore.

May present with:

- Pimples
- Large ulcers
- Deep ulcers

**Abstract**

**BACKGROUND**

Pyogenic arthritis, pyoderma gangrenosum, and acne (PAPA) syndrome is a rare autosomal dominant genetic disease characterized by severe autoimmune inflammation, caused by mutations in the *PSTPIP1* gene. Due to PAPA heterogeneous clinical manifestation, misdiagnosis or delayed diagnosis are difficult to avoid. With the
