**Risk factors for distant metastasis of dermatofibrosarcoma ...**  
[europepmc.org/articles/PMC4999380](https://europepmc.org/articles/PMC4999380)

Sep 01, 2016 · Introduction. Dermatofibrosarcoma protuberans (DFSP) is a tumor that develops in skin or subcutaneous tissue and is characterized by a protuberant growth pattern [1]. DFSP often recurs locally after surgery, but rarely metastasizes to distant sites and is classified as a sarcoma of intermediate-grade malignancy [2-7]. DFSP sometimes appears with fibrosarcomatous transformation in a subset of ...

This likely is driven by 2 main factors: margin status and the inclusion of patients with recurrent disease. First, although the majority of patients underwent R0 resection (65.5%), this was defined by the authors as clearance of a minimum of only 1 mm, with no further quantification provided.

**Dermatofibrosarcoma protuberans**

Dermatofibrosarcoma protuberans is a rare locally aggressive malignant cutaneous soft tissue sarcoma. DFSP develops in the connective tissue cells in the middle layer of the skin. Estimates of the overall occurrence of DFSP in the United States are 0.8 to 4.5 cases per million persons per year. In the United States, DFSP accounts for between 1 and 6 percent of all soft tissue sarcomas and 18 percent of all cutaneous soft tissue sarcomas. In the Surveillance, Epidemiology and End Results tumor registry from 1992
