SPECIFIC COMMENTS TO AUTHORS

The authors reported a case of primary PNET in the pericardium. Major 1. The authors tried to focus on image findings of PNET (as stated in the title) but the conclusion is not that helpful. Is this case study still worth reporting? 2. Can the authors summarize all reported PNET cases (not just pericardium) and specifically the image findings? Minor Abstract ...confirm the diagnosis of primary (PNET) of the pericardium. Please correct.

SPECIFIC COMMENTS TO AUTHORS

The title reflects the main subject/hypothesis of the manuscript. The abstract summarizes and reflects the work described in the manuscript. Keywords reflect the focus of the manuscript. The manuscript adequately describes the background, present status, and significance of the study. The research objectives achieved by the case presented here is to emphasize the existence of PNET in rare locations such as pericardium and points out this tumor should be taken into consideration in the differential diagnosis of solid cardiac masses, especially in children. The discussion should be revised. The pathological differential diagnosis should be described in more detail to inform the readers. Although radiographic images that are sufficient and appropriately illustrative of the paper content are presented, the microscopic and immunohistochemical findings, which are the primary tool for the correct diagnosis, are missing and should be presented. The manuscript appropriately cites the latest, influential, and authoritative references in the introduction and discussion section. The style, language, and grammar are accurate and appropriate. However, there are many repetitions in the text and should be avoided. The final diagnosis is performed by pathological examination. However, there is not any pathologist among the authors. In conclusion: The original finding of this manuscript is the third reported case of PNET in the pericardium. The case presented here demonstrates that imaging is not a gold standard for precise diagnosis. The quality and importance of this manuscript arise from the rarity of the case reported here. This case emphasizes that the rarity of primary PNET of the pericardium does not exclude its consideration in the differential diagnosis of solid cardiac masses. The case presented here should prompt the author to perform further studies to reveal molecular alterations, which should aid in the differential diagnosis and treatment of this aggressive tumor.
