SPECIFIC COMMENTS TO AUTHORS

Glycogen storage disease (GSD) is a kind of recessive inherited disorder of glycogen metabolism. According to the difference of enzyme deficiency and transporter, it has been divided into 16 types, most of which are autosomal recessive. Inflammatory bowel disease (IBD) is rare in patients with glycogen storage disease (GSD). This paper reports a 23-year-old man with GSD IB and IBD like diseases for 10 years. After full evaluation, the patient received minimally invasive surgery and discharged in a stable condition. In the case report, the information is detailed and has great reference value. Minimally invasive surgery for IBD has the advantages of less injury, less pain, faster recovery of gastrointestinal function and shorter postoperative hospital stay. This study confirmed that minimally invasive surgery has more obvious advantages for patients with GSD and IBD. This paper also discusses the perioperative management, which has a good clinical guidance value. . The authors conclude that minimally invasive surgery is recommended for patients with GSD and IBD, which is safe, feasible and effective. If the preoperative preparation is sufficient, it can promote rapid and complete recovery. This conclusion puts forward the principle and direction of treatment for patients with GSD and IBD, which is worthy of further study and confirmation.
