#### **SPECIFIC COMMENTS TO AUTHORS**

HCV co-infection is the leading cause of liver-related disease in AIDS patients, with higher morbidity and mortality than in patients infected with HCV alone. The authors conclude that DAA therapy has shown good results in patients with hepatitis C virus/HIV co-infection, and has been found to achieve SVR rates similar to those in patients with hepatitis C virus single infection. Proper selection of drug therapy is crucial, but the interaction between drugs and ART should be considered to avoid adverse reactions and reduce the incidence of SVR. In order to help the reader better understand the treatment of HCV combined with HIV, the author should summarize the infection rate of HCV with or without HIV in Table, and compare the treatment effect of HCV treatment and HCV plus HIV.

#### **SPECIFIC COMMENTS TO AUTHORS**

This review focused on the treatment of patients with HIV/HCV coinfection. DAA treatment has shown good efficacy in HCV/HIV-coinfected patients and has been found to achieve SVR rates similar to those of HCV-monoinfected patients. This review also focused on some special patients such as the HBV-coinfection. However, the literature were some outdated and the viewpoints were some outdated too. So I am afraid that it is not suitable for publication in the World Journal of Gastroenterology.
