Isolated fungus ball mimicking mucocele or frontal sinus ...

https://www.cambridge.org/core/journals/journal-of-...

Dec 23, 2009. Isolated frontal sinus fungus ball is a rare cause of frontal sinus disease. We present two cases of isolated frontal sinus fungus ball which pre-operatively were suspected to be either a tumour or a mucocele. In both cases, cheesy, clay-like material was found intra-operatively within the frontal sinus, suggesting a fungus ball.

been denominated as, "fungus ball". Looking back, one of the interesting points of this case lies in the radiographic findings, the hyperostosis (osteitis) in the left ethmoid is surrounded by high-density images caused by the heavy metals that the fungi contain, which can make it difficult to discern the implantation zone of the tumour. Case report

Jan 28, 2019 - Under general anesthesia, a left middle meatal antrostomy and anterior ethmoidectomy were performed followed by a frontal sinusotomy. Due to an isolated most posterior ethmoid cell lesion, an endoscopic surgery of the right sinus was subsequently performed via the sphenomethmoidal recess (). The supreme meatus was obstructed by swollen mucosa and opened by resection of the lower half ...

Sep 01, 2007 - Fungus Ball. Also known as mycetoma, fungus ball is a relatively uncommon manifestation of fungal sinusitis. The most widely accepted pathogenesis theorizes a deficient mucociliary clearance mechanism in which fungal organisms deposited in the paranasal sinuses are inadequately cleared.

Paranasal sinus fungus ball: diagnosis and management

https://citeseerx.ist.psu.edu/viewdoc/download?doi=...

Paranasal sinus fungus ball is an extramucosal, intra-sinusal mycosis, usually occurring in immunocompa-tert people as a monolateral lesion mainly caused by Aspergillus spp 1,9,11-13 They occur in adult patients and show a female predominance. No paediatric cases have been reported. Plaignaud [14] described the first case report in the

Case Presentation

Discussion

Conclusion

Introduction: Acute invasive fungal rhinosinusitis (AIFRS) is a potentially fatal infection, usually affecting immunocompromised patients. Isolated sphenoid sinus involvement is rare and has been reported in only a few cases. We discuss the clinical characteristics, histopathologic features, and differential diagnosis of AIFRS of the sphenoid sinus. Case Presentation: A 57-year-old man with a history of refractory non-Hodgkin lymphoma an... See more on thepermanentjournal.org

ma cell neoplasm that arises in soft tissues at single or mul-tiple sites [1]. Most EMPs occur in the head and neck region, with the nasopharynx, nasopharynx and oropharynx being the most common sites [2]. We report an extremely rare case of EMP coexisting with fungus balls in the paranasal sinuses that was initially treated as fungal sinusitis.

An Unusual Presentation of Fungal Mass in Concha Bullosa

https://file.scirp.org/Html/10-2460211_49854.htm

Mahmut Ozkiris et al. reported a case of a 55-year-old woman with fungal ball in concha bullosa presenting with anosmia. Ciger et al. reported the presence of a dark brown fungal ball during endoscopic resection of concha bullosa in a 29-year-old woman. We present one such case of a young female patient with an isolated fungal mass in the left middle concha without any evidence of fungal

Fungal sinusitis

Symptoms

Diagnosis

Fungal sinusitis is the inflammation of the lining mucosa of the paranasal sinuses due to fungal infection. It occurs in people with reduced immunity. The maxillary sinus is the most commonly involved. Fungi responsible for fungal sinusitis are Aspergillus fumigatus, Aspergillus flavus, and Aspergillus niger. Fungal sinusitis occurs most commonly in middle-aged populations. Diabetes mellitus is the most common risk factor involved.

Isolated fungus ball in a single cell of the left ethmoid roof: A case report

Zhou LQ et al. FB in the left ethmoid roof

Liu-Qing Zhou, Ming Li, Yong-Qin Li, Yan-Jun Wang

Abstract

BACKGROUND

Isolated fungus ball (FB) in a single cell of the left ethmoid roof is a very rare condition.

CASE SUMMARY

We report the case of a 51-year-old female patient whose computed tomography presented a soft tissue mass filling in the left ethmoid roof cell. The patient did not
