

### Superficial CD34-positive fibroblastic tumor: Report of an ...

<https://www.e-ijd.org/article.asp?issn=0019-5154;...>

In summary, we report a new case of superficial CD34-positive fibroblastic tumor. It is characterized by a superficial location, striking cellular atypia, extremely low mitotic rate, and strong diffuse CD34 positivity, and negative for COL1A1 gene rearrangement. Based on limited available data, these tumors have intermediate (borderline) malignancy with rare metastatic potential.

Abstract. Earlier, categorized under low grade malignant fibrous histiocytoma and low grade sarcomas, 'superficial CD34 positive fibroblastic tumor', a newly proposed entity, is a low grade mesenchymal tumor of intermediate malignant potential. Morphological features include monomorphic neoplastic spindle cells arranged in a fascicular to storiform pattern along with sheets of pleomorphic epithelioid cells, and ...
