#### **SPECIFIC COMMENTS TO AUTHORS**

The current treatment of carotid artery stenosis mainly includes drugs and invasive treatment, which comprises carotid endarterectomy and carotid artery stenting. Carotid artery stenting had the same effect as carotid endarterectomy in treating symptomatic and asymptomatic carotid stenosis. As the authors said, there are no cases of ileum hemorrhagic infarction caused by mesenteric artery embolism after carotid artery stenting have been reported. In this point of view, this case is rare. The case is described very detail, include the complaints, history of present and past illness. The diagnosis is reasonable, and the treatment is successful. In my opinion, this case report is overall very interesting, and it can be accepted after a minor editing. Thank you very much.
