On 30th January 2020, COVID-19, formerly known as 2019 novel coronavirus (2019-nCoV), was declared to be a global health emergency by the World Health Organization[1]. Dramatic measures have been put in place to halt the progression of the virus, and as of 6th February, COVID-19 has infected over 28,000 patients with 564 confirmed deaths [2]. Knowledge of COVID-19 is still evolving, but anecdotal evidence is available suggesting that patients can be asymptomatic and infective for up to 14 days [3]. It is clear tha...

In this review, we present the current approach to imaging of COVID-19 pneumonia. We focus on the appropriate utilization of thoracic imaging modalities to guide clinical management. We also describe radiologic findings that are considered typical, atypical and generally not compatible with COVID-19.
