The use of **neoadjuvant chemotherapy** in **resectable colorectal cancer** with **liver metastases** is currently under debate. It is argued that **chemotherapy** in **patients with resectable** disease could eradicate any undetectable **metastases** at the time of diagnosis and prevent further progression.

Neoadjuvant chemotherapy for resectable colorectal liver ...

https://www.sciencedirect.com/science/article/pii/S1479666X14000997

Apr 01, 2015 · A systematic literature search was performed to identify all studies published from January 2003 up to and including January 2014 regarding patients with initially resectable colorectal liver metastases. Data were examined for information about indications, operation, neoadjuvant and adjuvant therapies, perioperative results, and survival.

Use of Neoadjuvant Chemotherapy Plus Molecular Targeted ...

https://pubmed.ncbi.nlm.nih.gov/27174607

Background: Surgery remains the standard of care for patients with colorectal liver metastases (CLMs), with a 5-year survival rate approaching 35%. Perioperative chemotherapy confers a survival benefit in selected patients with CLMs. The use of molecular targeted therapy combined with neoadjuvant chemotherapy for CLMs, however, remains controversial.

Apr 20, 2016 · For patients receiving neoadjuvant chemotherapy, chemotherapy-associated liver injury remains a concern and is associated with a poorer short-term prognosis. 16 Although 20–25% of patients receiving neoadjuvant chemotherapy experience liver-related complications post-surgery, this has not been shown to be significantly different to those receiving surgery-alone. 17, 18 Other factors, such as obesity, may have a greater influence on liver-related ...

https://www.mdpi.com/2072-6694/13/3/378/htm

This systematic review and meta-analysis assessed the potential additive value of neoadjuvant chemotherapy before repeat local treatment. The addition of neoadjuvant chemotherapy prior to repeat local treatment was suggested by merely all authors, though supporting evidence is lacking.

In the United States, colorectal cancer was predicted to have the fourth highest rate of incidence of new diagnoses among all cancers in 2015, with over 130,000 new cases expected.[1,2] Twenty percent of patients with newly diagnosed colorectal cancers present with metastatic disease. The average 5-year survival for metastatic colorectal cancer is 12.9%. Surgical resection is the only potentially curative option for patients with this disease. However, there are limitations to its use, since less than 15% of pa...
